The microcentrifuge rotor is a core component of a centrifugal device designed for processing micro samples. It is usually made of high-strength engineering plastics or lightweight alloys, and is equipped with multiple micro-holes (such as 0.2 mL to 2 mL capacity) to accommodate small-volume centrifuge tubes. The rotor uses a precision balanced design to ensure stability during high-speed rotation (the speed range is generally 5,000 rpm to 20,000 rpm), and uses centrifugal force to achieve rapid sedimentation and separation of suspended particles in micro samples. It is widely used in experimental scenarios that are sensitive to sample volume, such as nucleic acid extraction, protein purification, and clinical sample pretreatment.

United States market for Microcentrifuge Rotor is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
