Micrococcal nuclease (MNase) is an endonuclease enzyme derived from the bacterium *Micrococcus luteus*, capable of cleaving phosphodiester bonds within nucleic acids, primarily DNA and RNA. Unlike other nucleases, MNase exhibits a preference for cleaving DNA in linker regions between nucleosomes, generating DNA fragments of variable lengths. This unique property makes MNase a valuable tool in chromatin structure studies, where it is used to digest chromatin and map nucleosome positioning. MNase is also employed in DNA footprinting assays and in the analysis of nucleic acid-protein interactions, contributing to our understanding of gene regulation and genome organization.

The global Micrococcal Nuclease market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
