Microcrystalline reflective mirrors are reflective optical components made of glass-ceramic materials using a special process. They are characterized by extremely low expansion coefficients, excellent mechanical strength, and excellent thermal stability. This type of mirror can maintain shape and size stability in extreme temperature changes, and thus has excellent optical performance and reliability. The advantage of glass-ceramic mirrors is that they can not only provide high-definition reflected images, but also withstand high-energy laser irradiation without damage, making them play a vital role in precision optical systems. Their unique material properties and processing accuracy ensure their high performance in various complex environments, making them an indispensable key component in many high-tech fields.
