The global Microencapsulated Feed Additives market size is predicted to grow from US\$ 235 million in 2025 to US\$ 363 million in 2032; it is expected to grow at a CAGR of 6.5% from 2026 to 2032.

Microencapsulated feed additives are a type of feed additive prepared using microcapsule technology. Microcapsule technology refers to the method of completely encapsulating dispersed solid substances, liquid droplets or gases in a dense membrane to form microcapsules. The resulting tiny particles are called microcapsules. When this technology is applied to the feed industry, microcapsule feed additives are obtained.

Microencapsulated feed additives have many advantages. First, it can change the state, quality and volume of substances, improve their stability, solubility and fluidity. Secondly, it can protect highly sensitive substances, improve resistance to sensitive environmental factors such as light, heat, oxygen, humidity and strong acids and alkalis, and prevent and delay feed spoilage. In addition, it can also reduce volatility and prolong the retention period of flavoring agents and other substances.

In the feed industry, microcapsule feed additives can solve some problems of effective ingredients in the process of processing, preservation and reproduction. For example, some commonly used feed additives such as vitamins, amino acids and probiotics have problems such as difficulty in transportation and preservation and short shelf life in actual application, and the use of microcapsule technology can effectively solve these problems. At the same time, microcapsule technology can also cover up some bad flavors, increase the feed intake of animals, and achieve sustained release and reduce stress response.

In general, microcapsule feed additives have brought many conveniences and advantages to the feed industry through their unique coating technology, which helps to improve the quality of feed and the growth performance of animals.
