Microfluidic PCR chips can be divided into two different structural types: microchamber PCR and continuous flow PCR. In a microchamber PCR chip, after the sample is injected into the well, the chip is heated and cooled at a specific thermal cycle temperature. The CF-PCR chip transports samples to a fixed temperature zone to achieve thermal cycling. CF-PCR chips can be further subdivided into serpentine channel devices, spiral microchannel devices, oscillation devices, closed-loop devices, straight channel devices, etc. These types of designs make microfluidic PCR devices widely used in molecular biology fields such as genetic testing and molecular sequencing.

The global Microfluidic PCR Chip market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
