Microfluidic PCR chips can be divided into two different structural types: microchamber PCR and continuous flow PCR. In a microchamber PCR chip, after the sample is injected into the well, the chip is heated and cooled at a specific thermal cycle temperature. The CF-PCR chip transports samples to a fixed temperature zone to achieve thermal cycling. CF-PCR chips can be further subdivided into serpentine channel devices, spiral microchannel devices, oscillation devices, closed-loop devices, straight channel devices, etc. These types of designs make microfluidic PCR devices widely used in molecular biology fields such as genetic testing and molecular sequencing.
