The global Microkernel Real-Time Operating System (?RTOS) market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Microkernel Real-Time Operating System (?RTOS) is an operating system designed for real-time. It uses a microkernel architecture to improve system reliability, security, and scalability. Unlike traditional macrokernel operating systems, microkernel operating systems limit the core functions of the operating system (such as process management, memory management, device drivers, etc.) to a small kernel. Other services (such as file systems, network protocol stacks, etc.) run in user space as independent processes. A real-time operating system (RTOS) is able to ensure that specific tasks are completed within strict time limits. It usually provides a priority scheduling algorithm to ensure that high-priority tasks can be executed in a timely manner. Microkernel RTOS is designed to achieve low latency, which is critical for many real-time applications (such as industrial control, automotive systems, etc.). Microkernel architecture provides better security due to the isolation between services. If a service crashes, it is unlikely to affect the stability of the entire system. Microkernel real-time operating systems are widely used in embedded systems, automotive electronics, aerospace, industrial automation, and other fields. Some well-known microkernel RTOS include VxWorks, Intewell OS, etc. The choice of which RTOS depends on the specific application requirements, performance requirements, development resources, and cost considerations.
