The micromirror array chip is an opto-mechanical-electrical integrated semiconductor display chip. It consists of thousands of tiny tiltable micromirrors, each of which represents a pixel and can adjust the angle according to the input signal to reflect light, thereby realizing the display of the image. The core function of the DMD chip is to act as a spatial light modulator, which modulates the direction of the reflected light by controlling the tilt state of the micromirror (usually  $+12^\circ$  and  $-12^\circ$ ) to achieve the purpose of displaying the image. Due to its unique advantages, DMD technology has been widely used in many fields, and with the continuous development of technology, its application scope continues to expand.

United States market for Micromirror Array Chip is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
