Nano 3D printing technology can produce high-precision parts with dimensions less than 100 nanometers. In terms of size, nano 3D printing and micron-level 3D printing are both micro 3D printing technologies. Unlike ultra-large-scale 3D printing technology, micro-3D printing (microns are a thousand times larger than nanometers, but still only one-thousandth of a millimeter) is the other extreme—a move toward smaller sizes. Additionally, microscopic 3D printing has the potential to fundamentally disrupt the medical device field due to its more precise and less invasive nature. Equipment used in surgery and laboratories often requires high precision and high surface finish, and is usually produced in small batches.

The global Micron and Nanoscale 3D Printer market size is projected to grow from US\$ 98 million in 2024 to US\$ 266 million in 2030; it is expected to grow at a CAGR of 18.0% from 2024 to 2030.
