The global Micronized Acellular Dermal Matrix (mADM) market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Micronized Acellular Dermal Matrix (mADM) is a biocompatible material derived from human or animal dermis, which has been processed to remove cellular components while preserving the extracellular matrix structure. The micronization process involves breaking down the acellular dermal matrix into smaller particles, which can be formulated into a paste or injectable form. This matrix serves as a scaffold that supports tissue regeneration and repair by promoting cell infiltration and neovascularization. mADM is particularly used in wound healing, as it provides a structural framework that facilitates the closure of difficult-to-heal wounds, such as those resulting from burns, ulcers, or surgical procedures. It can be applied in various clinical settings, often in combination with other therapies like negative pressure wound therapy (NPWT), to enhance healing outcomes and improve patient comfort and satisfaction.

United States market for Micronized Acellular Dermal Matrix (mADM) is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
