Micronized polyethylene wax is the product of polyethylene wax after micronization processing. During the production of polyethylene, a small amount of oligomers, namely low molecular weight polyethylene, is also produced, which is also called high molecular wax and abbreviated as polyethylene wax. Because of its excellent cold resistance, heat resistance, chemical resistance and abrasion resistance, it has been widely used.

The method of micronization can use Jet-Microniser or Microniser/Classifier production process, that is, the coarse wax is gradually broken into particles after violently colliding with each other at high speed. It is collected by the centrifugal force and blown out under weightlessness.
