The global Microparticle Chemiluminescence Reagent market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Microparticle chemiluminescence reagent (MCR) is a reagent used for immunoassay to detect the presence of specific antibodies or antigens in samples. MCRs are composed of small particles coated with specific antigens or antibodies, which can bind to the corresponding antibodies or antigens in the sample. When particles combine with target molecules, they trigger a chemiluminescence reaction, producing light that can be detected using specialized instruments. The intensity of the generated light is proportional to the weight of the target molecule present in the sample for quantitative analysis.
