The report requires updating with new data and is sent in 48 hours after order is placed.

Microsphere drug delivery system is a new and multifunctional drug delivery system. Specifically, microspheres refer to tiny spherical entities formed by dissolving or dispersing drugs in a polymer material matrix, and their particle size is usually between 1 and 250 μ m. When drugs are encapsulated in microspheres, because the microspheres have special affinity with certain cell tissues, they can be endocytosed by the reticuloendothelial system (RES) of the organ tissue or fused by cells, concentrate in the target area, and gradually diffuse. Drugs are released or degraded by enzymes in lysosomes. Therefore, microspheres as drug carriers can achieve sustained release and prolong drug action time.

The global Microsphere Drug Delivery System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
