## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Microwave backhaul refers to the transportation of traffic (voice, video and data) between distributed sites and a more centralised point of presence via a radio link. Operators can lease microwave spectrum and build networks that deliver several E1/T1s, STM1/OC3s and Ethernet services over the air, providing an instant, reliable and relatively low-cost solution to the growing global demand for backhaul capacity. Microwave is already the backhaul technology used by most mobile operators worldwide, and outside the US nearly 70% of backhaul traffic travels over microwave links. This trend is likely to continue since microwave is a scalable and economical backhaul option compared to leased line copper and new fibre.

The global Microwave Backhaul Radio Links market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
