The global Mid- to High-end Digital Oscilloscope market size is predicted to grow from US\$ 1236 million in 2025 to US\$ 1866 million in 2032; it is expected to grow at a CAGR of 6.2% from 2026 to 2032.

A digital oscilloscope is a high-performance test equipment that combines multiple technologies such as data acquisition, analog-to-digital conversion (A/D conversion), and software programming. Its working principle is to use an analog-to-digital converter (ADC) to convert the measured voltage signal into digital information. The digital oscilloscope captures a series of sample values of the waveform and stores these sample values until the accumulated samples are sufficient to depict the complete waveform. After that, the oscilloscope will use these sample values to reconstruct the waveform. According to the core performance indicator-bandwidth, digital oscilloscopes can be divided into three categories: low-end, mid-end, and high-end. The bandwidth of low-end digital oscilloscopes is less than 300MHz, and the sampling rate does not exceed 2GSa/s; the bandwidth of mid-range digital oscilloscopes ranges from 300MHz to 2GHz, and the sampling rate is between 2GSa/s and 5GSa/s; and the bandwidth of high-end digital oscilloscopes exceeds 2GHz, and the sampling rate also reaches 5GSa/s or above.
