The Midface Distractor is an internal device for the treatment of cranial or midface conditions for which reconstructive osteotomy and segment advancement are indicated.

The distraction process, or distraction osteogenesis, has become an important treatment modality for patients with craniofacial abnormalities. Today, when a child or adult suffers from a craniofacial deformity, such as an overbite or cleft palate, they can undergo distraction osteogenesis, in which a surgeon pierces certain bones in the face and installs a bone-lengthening device (i.e., an external midface retractor), the bone lengthening device is attached to the patient's bone on either side of the incision. Thereafter, the bony segments are gradually separated (ie, distracted) with the external retractor to obtain the desired new facial contour.
