## Abstracts

The global Midline Catheter Kit market size is predicted to grow from US\$ 338 million in 2025 to US\$ 516 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

A midline catheter is a medium-length intravascular catheter, usually 15-25 cm in length, inserted through a peripheral vein (such as the basilic, cephalic, or brachial vein), with the tip located in the axillary or subclavian vein, but not beyond the central vein. Its design is between a short peripheral catheter and a central venous catheter, and is suitable for patients who require medium- to long-term (1-4 weeks) intravenous treatment, such as antibiotic infusion, fluid replacement, or pain management. Compared with central venous catheters, midline catheters have a lower risk of complications and can tolerate hypertonic solutions; compared with short peripheral catheters, they can reduce repeated punctures and reduce the risk of phlebitis, but cannot be used for the infusion of highly irritating drugs or long-term parenteral nutrition. It is commonly used in clinical scenarios where low and medium osmotic pressure treatment is required and must be inserted by professional medical staff.

In 2024, global production of midline catheters reached 3.5 million sets, with an average selling price of US\$95 per set.

In recent years, the global midline catheter market has shown steady growth, driven primarily by increasing demand for medium- and long-term intravenous therapy in hospitalized patients, a focus on reducing central venous catheter-related complications, and the need to control healthcare costs. North America and Europe currently dominate, benefiting from mature healthcare systems and high clinical acceptance; while the Asia-Pacific region (such as China and India) has seen significant growth due to improved healthcare infrastructure and the widespread adoption of minimally invasive treatments. Product innovations (such as ultrasound-guided insertion

technology and catheters coated with anti-infective coatings) and recommendations from clinical guidelines are further driving market expansion. However, the market still faces challenges, such as inadequate medical staff training, limited medical insurance coverage in some regions, and competition with peripherally inserted central catheters (PICCs). Overall, with the increasing aging population and demand for chronic disease management, the midline catheter market holds a promising future.
