The global Milk Teeth Bank market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A Milk Teeth Bank is a facility that stores and preserves milk teeth, also known as baby teeth, for potential future medical use. These facilities collect and process the teeth, extracting stem cells from the dental pulp, which have the potential to develop into various types of cells and tissues. The bank then stores these stem cells for potential use in regenerative medicine treatments for conditions such as dental, bone, and even certain systemic diseases.

The industry trend of Milk Teeth Banks is experiencing growth due to the increasing interest in stem cell technology and regenerative medicine. As research continues to uncover new potential uses for dental stem cells, there is a growing emphasis on the development of efficient collection, processing, and storage methods to support potential future medical advancements. Additionally, the trend includes a focus on educating the public about the value of preserving dental stem cells and expanding the accessibility of Milk Teeth Banks.
