The global Millimeter Wave Radar for Unmanned Driving market size is predicted to grow from US$ 1379 million in 2025 to US$ 4102 million in 2031; it is expected to grow at a CAGR of 19.9% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Unmanned Driving Millimeter Wave Radar is an advanced sensing device based on high-frequency electromagnetic waves (covering frequency bands such as 24GHz, 77GHz, and 79GHz), playing a pivotal role in autonomous driving technology. By emitting millimeter waves and precisely analyzing reflected signals, it can simultaneously acquire multi-dimensional information about targets, including distance, velocity, angle, and altitude, providing unmanned vehicles with comprehensive environmental perception capabilities. Employing a Frequency Modulated Continuous Wave (FMCW) system, it features all-weather and all-climate operational characteristics, effectively compensating for the limitations of optical sensors in harsh environments. Among them, the 77GHz and 79GHz frequency band radars, with their high precision and long-range detection capabilities, serve as the mainstay for long-distance sensing, while the 24GHz radar, leveraging its cost advantages, plays a significant role in short- to medium-range sensing. Furthermore, the integration of 4D imaging radar has further enhanced target identification accuracy and dynamic tracking capabilities, providing a robust foundation for the safety and reliability of unmanned driving technology.
