Metal powder injection molding (MIM) is a classification of powder injection molding technology (Powder Injection Molding, referred to as PIM). Metal Injection Molding (Metal Injection Molding) is a kind of component that introduces modern plastic injection molding technology into the field of powder metallurgy and integrates plastic molding technology, polymer chemistry, powder metallurgy technology and metal materials science and other disciplines. New 'near net shape' technology. It can use molds to inject blanks, and quickly manufacture high-precision, high-density, three-dimensional complex-shaped structural parts through sintering, and can quickly and accurately materialize design ideas into products with certain structural and functional characteristics, and can be directly processed. Mass production. MIM technology combines the technical advantages of plastic injection molding and powder metallurgy. It not only has the advantages of less conventional powder metallurgy processes, no cutting or less cutting, and high economic benefits, but also overcomes traditional powder metallurgy. The main disadvantages of low performance, thin wall, difficult to form and complex structure, suitable for mass production of small, precise, complex three-dimensional shape and the manufacture of metal parts with special requirements.

MIM feedstock include stainless steel feedstock, steel feedstock, copper feedstock, manganese alloy feedstock, and other alloy/metal feedstock.
