The global Mine Conveying Monitoring System market size is predicted to grow from US\$ 1673 million in 2025 to US\$ 2763 million in 2032; it is expected to grow at a CAGR of 7.5% from 2026 to 2032.

In 2025, global sales of mine conveying monitoring systems reached 9,500 units, with an average selling price of US\$180,000 per unit. A mine conveying monitoring system is an intelligent monitoring and control platform applied to mine belt conveyors and material handling systems. It integrates sensor networks, data acquisition terminals, industrial communication modules, and centralized control software. It can monitor and provide fault warnings in real time for conveyor belt tension, speed, temperature, vibration, belt misalignment, and coal flow status, enabling remote scheduling and automated linkage control. This improves transportation safety and operational efficiency, making it an important component of smart mine construction. The industry's total production capacity is approximately 12,000 units per year, with an average gross profit margin of approximately 28%. Upstream suppliers mainly include industrial sensors, PLC controllers, industrial control computers, communication modules, and software development services; downstream suppliers are coal and metal mining companies through mine equipment integrators and automation engineering companies. The future lies in deep integration with AI algorithms and digital twin platforms, driving upgrades to unmanned operation and predictive maintenance. With increasingly stringent mine safety regulations and accelerated intelligent transformation, market demand continues to grow, and companies with integrated hardware and software and system integration capabilities will gain greater business opportunities.
