The global Mine Truck Engine market size is predicted to grow from US\$ 1299 million in 2025 to US\$ 1634 million in 2032; it is expected to grow at a CAGR of 3.4% from 2026 to 2032.

In 2024, global mining vehicle engine production reached 56,690 units, with an average selling price of \$22,500 per unit. Mining vehicle engines are the engines that power mining vehicles and are typically internal combustion engines (diesel or natural gas) or the speed control/drive units in electric drive systems. Mining applications place high demands on engines, requiring high reliability, low emissions, good cold-temperature starting performance, and resistance to dust and vibration.

In recent years, the market size of my country's mining vehicle industry has shown steady growth. With the continued development of the domestic mining industry, mining vehicles, as key equipment for mining area transportation, have seen their market size continue to expand. After years of development, the quality of my country's mining vehicles has significantly improved. From the selection of raw materials to the control of production processes, to the inspection and acceptance of finished products, every process has become more rigorous. In the future, as my country's demand for mineral resources continues to grow, the development of the mining industry will further drive the expansion of the mining vehicle market.

By 2023, china's total engine production will reach a certain scale and show a steady growth trend. In 2024, China's total engine production will reach 237,766,800 kilowatts, a year-on-year decrease of 1.5%. From January to March 2025, my country's engine production will reach 586,186,000 kilowatts, a year-on-year decrease of 0.6%.

Traditional diesel engines provide powerful power for mining vehicles, meeting their traction needs under heavy loads. Mining vehicles often need to navigate complex mining roads, such as steep slopes and muddy sections. High-performance diesel

engines ensure smooth passage. After years of development, traditional fuel engine technology has matured, and its reliability can meet the long, intensive operations required by mining vehicles. Mining vehicles operate in harsh environments and have long working hours. Engine reliability is directly related to vehicle availability and productivity.
