The global Mineral Flotation Cells market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Flotation cells are used to separate minerals in a liquid solid suspension of desired and undesired materials. The desired solids are separated by making them hydrophobic, so they will attach to air bubbles that are created with either air injection or agitation along with a reagent.

Froth flotation is a process for separating minerals from gangue by exploiting differences in their hydrophobicity.
