The mini float level switch is a liquid level control device with a simple structure and easy to use. It uses a floating ball (usually a magnetic float) to rise or fall with the liquid level, and drives the internal magnet of the switch through the lever principle, thereby causing the sensor to detect the reed switch chip at the set position in the tube to act and send out a contact on/off conversion signal. This kind of switch does not contain bellows, springs, seals and other components that can easily cause failure. It has a simple lever structure and can quickly respond to changes in liquid level.

The global Mini Float Level Switch market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
