The global Mini LED Packaging market size is predicted to grow from US$ 5804 million in 2025 to US$ 7995 million in 2032; it is expected to grow at a CAGR of 4.8% from 2026 to 2032.

Mini LED packaging is a key manufacturing process that integrates micron-sized Mini LED chips with driving circuits, protective materials, and other components through specific processes and technologies to form a robust, stable, reliable, and easy-to-use light-emitting device. The Mini LED industry chain encompasses upstream chip manufacturing, midstream packaging, and downstream modules and applications. The upstream chip market is highly concentrated, with leading companies such as Sanan Optoelectronics and HC SemiTek dominating. The midstream packaging technology roadmap is diverse and represents the most active area for innovation. Besides COB and MIP, flip-chip technology, due to its wire-free design, high reliability, and excellent heat dissipation, has become key to improving packaging efficiency. Downstream applications are rapidly expanding from traditional commercial large screens to high-end TVs, automotive displays, VR/AR devices, and other fields.

COB and MIP are the two most watched technologies in the Mini LED direct-view display field, each with its own focus and fierce competition. COB technology emphasizes overall performance. Because it integrates multiple pixels during the packaging stage, it has advantages in reliability, sealing, and overall display effect, making it particularly suitable for high-end command centers, broadcasting centers, and other scenarios with extremely high requirements for product lifespan and stability. MIP technology emphasizes process optimization and cost. It acts like a 'standardized' prefabricated component, better aligning with the concept of modular production. It can flexibly adapt to different pixel pitch requirements, showing great potential in reducing

production costs and improving production efficiency, and is currently a key force driving the widespread adoption of Mini LED. COB can be considered to provide the 'final display panel,' while MIP provides 'high-quality standardized pixel components.' Both will coexist for a long time to meet the needs of different market segments. Packaging technology continues to innovate, with COB and MIP being the focus of competition. Application scenarios are expanding, rapidly penetrating from traditional commercial large screens to high-end TVs, automotive displays, VR/AR devices, and other fields. Leading companies are building a complete ecosystem from materials and equipment to manufacturing through mergers and acquisitions.
