A miniature inductive sensor is a compact, non-contact electronic device designed to detect the presence or movement of metal objects within a specific sensing range. These sensors operate based on the principle of electromagnetic induction, where an oscillating magnetic field is generated by a coil within the sensor. When a metal object enters this magnetic field, it causes a change in the inductance of the coil, which the sensor detects and interprets as the presence of a target. Due to their small size, miniature inductive sensors are ideal for applications where space is limited, such as in precision automation systems, robotics, and medical equipment. They offer high reliability, resistance to environmental factors such as dust and moisture, and long operational life, making them a preferred choice for detecting metallic objects in challenging or confined environments.

United States market for Miniature Inductive Sensor is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
