The miniature photoelectric sensor is a device that converts optical signals into electrical signals. It is a small photoelectric sensor, which has the characteristics of small size, space saving and low cost.

The miniature photoelectric sensor is composed of three parts: a transmitter, a receiver and a detection circuit. The transmitter is aimed at the target to emit a light beam. The emitted light beam generally comes from a semiconductor light source, a light emitting diode (LED), a laser diode and an infrared emitting diode. The light beam is emitted uninterrupted, or the pulse width is changed. The receiver consists of photodiode, phototransistor and photocell. In front of the receiver, optical components such as lenses and apertures are installed. Behind it is the detection circuit, which can filter out the valid signal and apply the signal. The micro photoelectric sensor converts the measured change into a change of optical signal, and then further converts the optical signal into an electrical signal by means of a photoelectric element.
