A micro proximity sensor is a small, highly sensitive sensor that is mainly used to detect the proximity or displacement change of an object. It achieves non-contact measurement through electromagnetic fields, electrostatic fields, or induction principles. When the target object approaches the sensor, it causes a signal change inside the sensor, resulting in a response. This type of sensor is widely used in fields such as automated control, robotics, smart devices, and precision instruments. Due to its compact design, it is suitable for installation in places with limited space and can detect objects efficiently and quickly.

United States market for Miniature Proximity Sensor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Miniature Proximity Sensor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
