Minimally invasive surgery is performed without making a major incision or opening, resulting in less trauma for the patient and yielding significant cost savings. These result from shorter hospitalization times and reduced therapy requirements. Other benefits of minimally invasive surgery are less pain, less need for postsurgical pain medication, less scarring, and less likelihood of complications related to the incision.

Thus, minimally invasive surgery is defined either as based on the operative procedure (e.g., small incisions) or the outcome (reduced surgical complications or costs). However, minimally invasive is not the same as minor surgery. Some “minimally invasive” procedures, (e.g., coronary artery bypass surgery), still are major operations requiring a hospital stay.

This report focus on Minimally Invasive Medical Devices market.
