Mirtazapine ACTS on central presynaptic receptor 2 antagonist and enhances adrenergic nerve conduction. It regulates the function of 5-HT by interacting with central serotonin (5-HT₂, 5-HT₃) receptors. Both of mirtazapine's optically active enantiomers have antidepressant activity, with the levorotatory block of type 2 receptor and 5-HT₂ receptor, and the right-handed block of 5-HT₃ receptor. Mirtazapine has sedative effects, is well tolerated, has almost no anticholinergic effects, and its therapeutic dose has no effect on the cardiovascular system.
