## Abstracts

The global Misch Metal market size is predicted to grow from US\$ 1031 million in 2025 to US\$ 1450 million in 2032; it is expected to grow at a CAGR of 5.1% from 2026 to 2032.

In 2024, global mixed metal production is expected to reach approximately 47,000 tons, with an average selling price of \$22,000/ton. Misch metal is a rare earth alloy primarily composed of lanthanide elements, typically including cerium (Ce), lanthanum (La), neodymium (Nd), and praseodymium (Pr). Misch metal was originally discovered as a complex mixture of rare earth elements in the Ytterby mine in Sweden. Because it was difficult to separate, it was called 'misch metal.' The term originated in the 18th century. Misch metal is a vital raw material in the rare earth industry, particularly in alloys, pyrotechnics, and magnetic materials. Misch metal is typically produced by oxide reduction or electrolysis and exhibits excellent chemical activity and reducibility.

The development of the mixed metals market is driven by multiple factors: advances in rare earth separation and purification technologies have significantly improved their performance in magnetic materials and energy storage. As the world's largest supplier of rare earths, China's export policies and environmental regulations have a profound impact on the global supply chain. With the rapid expansion of industries such as new energy vehicles, wind power, and electronic equipment, market demand continues to grow. However, the scarcity and difficulty of mining rare earth resources pose potential bottlenecks. In the future, mixed metal production will shift towards environmentally friendly, low-carbon, and intelligent manufacturing. Companies need to accelerate technological innovation and strengthen international cooperation to meet challenges and opportunities.
