The global MLCC Single Release Film market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

MLCC stands for Multi-Layer Ceramic Capacitor, which is an electronic component used for storing and releasing electrical charge. The MLCC Single Release Film is a type of film that is used in the production of MLCCs.

In the production of MLCCs, the MLCC Single Release Film is used as a substrate for the ceramic layers that make up the capacitor. The film is typically made of a high-temperature polymer material, such as polyethylene terephthalate (PET) or polyimide, that can withstand the high temperatures required during the ceramic layer deposition process.

The MLCC Single Release Film is designed to be easily removed from the ceramic layers after they have been deposited. This is important because it allows the ceramic layers to be stacked and bonded together to form the final capacitor structure. The film is typically removed by a process called "single release," which involves peeling the film away from the ceramic layers in a single motion.

United States market for MLCC Single Release Film is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
