MMIC stands for Single Chip Microwave Integrated Circuit, which is a series of semiconductor process methods used to manufacture passive and active components on a semi insulating semiconductor substrate, and connect them to form functional circuits applied in the microwave (even millimeter wave) frequency band. MMIC includes various functional circuits, such as low noise amplifier (LNA), power amplifier, mixer, up converter, detector, modulator, voltage controlled oscillator (VCO), phase shifter, switch, MMIC transceiver front-end, and even the entire transmission/reception (T/R) component (transceiver system). A low-noise amplifier is a special type of electronic amplifier mainly used in communication systems to amplify signals received from antennas, making it easier for subsequent electronic devices to process.

The global MMIC Low Noise Amplifier market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
