mmWave Vital Sensor is a sensor that uses millimeter wave radar technology to monitor human vital signs. The mmWave radar emits electromagnetic waves in the millimeter wave frequency band, which are reflected back by the human body after being irradiated. Because physiological activities such as human breathing and heartbeat cause tiny movements on the surface of the body, the reflected electromagnetic waves change in frequency and phase. The sensor extracts characteristic information related to breathing and heartbeat by analyzing the received reflected electromagnetic wave signals, and thus calculates vital sign parameters such as breathing frequency and heart rate.

United States market for mmWave Vital Sensor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
