The global Mobile Drip Irrigation System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Mobile drip irrigation (MDI) combines the high efficiency of surface drip irrigation with the flexibility, lower hardware costs and convenience of center pivot irrigation. In this system, the drip tubing is attached to center pivot irrigation systems to apply water directly to the soil surface as the driplines are dragged across the field and to create a uniform wetting pattern across the entire irrigated area.

Mobile Drip Irrigation System consists of heavy wall, in-line drip hoses in place of nozzles or sprinkler heads that are spaced 20 to 40 inches apart. The sprinklers can also be left in place in addition to the dripline in a dual-purpose setup that allows switching between sprinklers and drip. This spacing is chosen based on the crop, the soil type and the rooting depth of the crop. The length of the dripline that drags behind the center pivot depends on the flow rate needed and the area that is irrigated during the movement. The length of the dripline increases with distance from the center pivot to apply more water similar to a center-pivot nozzle package.
