The global Mobile Emission Control System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A mobile emission control system is a set of functions that includes the vehicle performing to keep emissions at the lowest possible level. With the help of emission control systems, harmful emissions such as carbon monoxide (CO), hydrocarbons (HC) and nitrogen oxides (NOx) can be minimized. We can usually divide emission control methods into two categories, preventive/active and destructive/passive. Vehicle engines have become more advanced and new technologies have reduced emissions. Small improvements such as the use of correct air/fuel ratios, enhanced combustion technologies and variable fuel ratios are some of these advances. However, we explain the more impactful and necessary emission control methods needed to comply with the new stringent emission standards.
