The report requires updating with new data and is sent in 48 hours after order is placed.

According to our (LP Info Research) latest study, the global Mobile EV Charger market size was valued at US\$ million in 2022. With growing demand in downstream market and recovery from influence of COVID-19 and the Russia-Ukraine War, the Mobile EV Charger is forecast to a readjusted size of US\$ million by 2029 with a CAGR of % during review period.

The research report highlights the growth potential of the global Mobile EV Charger market. With recovery from influence of COVID-19 and the Russia-Ukraine War, Mobile EV Charger are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Mobile EV Charger. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Mobile EV Charger market.

A mobile EV charger, also known as a portable EV charger or EV charging cable with built-in charging capabilities, is a device used to charge electric vehicles (EVs) on the go. It allows EV owners to charge their vehicles at locations where fixed charging infrastructure is not available or when they need to charge away from home or designated charging stations.

A mobile EV charger typically consists of a charging cable with connectors on both ends—one end plugs into the EV's charging port, while the other end is connected to a power source. The power source can be a standard electrical outlet or a generator, providing the necessary electricity to charge the vehicle's battery.

Mobile EV chargers are compact, lightweight, and designed for portability. They are often designed with features such as durable construction, weatherproofing, and safety mechanisms to ensure reliable and safe charging.

These chargers offer flexibility and convenience, allowing EV owners to charge their vehicles wherever there is access to a compatible power source. They are particularly useful for long-distance travel, emergencies, or situations where EV owners need to charge their vehicles in remote locations or areas with limited charging infrastructure.

The EV charging market is building a whole new infrastructure, which will be tightly integrated with electricity distribution networks. Building such an infrastructure does not happen overnight. With a compound annual growth in the range of 30% that infrastructure will become a significant player in its own rights before long. Looking towards 2024, we will see > 5Mio charging points in Europe and > 2 Mio in North America.

Use of installed charging points is accelerating, in some cases doubling every year. The faster this acceleration, the more the new infrastructure will depend on highly available and secure IoT connectivity. It is a truly mission-critical infrastructure, and for this reason, Charging Point Operators are requesting the best possible connectivity at each location.

Electric vehicle charging is an integral part of the total ecosystem. Charging Point Operators, Mobility Service Providers (Charging Service Providers), Electricity Distribution System Operators and Energy Service Providers stand to benefit from data generated by charging infrastructures. As are service providers of shared e-car or micromobility services, automotive OEMs, car parking operators, logistic hubs of all kinds, battery vendors moving towards a “Battery as a Service” business model, and others.
