## Abstracts

The global Mobile NAND Flash market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

NAND flash memory is a type of nonvolatile storage technology that does not require power to retain data. An important goal of NAND flash development has been to reduce the cost per bit and to increase maximum chip capacity so that flash memory can compete with magnetic storage devices, such as hard disks.

Compared to RAM + NOR, NAND based MCP solutions provide non-volatile storage of data. This means, unlike in the past when DRAM memory was used, NAND memory retains data even when the power is off — making it ideal as storage for portable devices. Similarly, POP and high-density embedded storage chips reduce the number of chips employed in a mobile device, thereby saving space and simplifying the design.
