The mobile browser is an on-device, client-side application that is resident on a mobile device. It provides access to content and applications from the Internet and, increasingly, in the cloud. Desktop and mobile browsers share many functions; however, increasingly, there are also differences, including the size of the screen, the power of the device (both processor and memory footprint), the speed of the network and the resources on the device. The browser for a mobile device has been considered a lower-functioning device than the browsers found on the desktop; as HTML5 and webkit-capable browsers find their way onto mobile devices, this is positioned to shift.

Global Mobile Browser main manufacturers include Google, Apple and Microsoft, totally accounting for over 93% of the market. North America is the largest market, with a

share over 50%. As for the types of products, it can be divided into default browser and user-installable browser. As for the operating system of products, it can be divided into Android, iOS and others. The most common type is Android, with a share about 80%. In terms of application, it is widely used in smartphone and tablet. The most common application is smartphone, which accounts for about 95% of all.
