The global MOCVD for LED market size is predicted to grow from US\$ 155 million in 2025 to US\$ 230 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

MOCVD for LED is a core epitaxial manufacturing technology used to deposit compound semiconductor layers, such as GaN-, GaAs-, and InP-based materials, for LED production. It enables precise control of layer thickness, composition, and doping, which is essential for achieving high luminous efficiency, wavelength uniformity, and device yield. In industrial applications, LED-oriented MOCVD systems emphasize high throughput, stable and repeatable processes, advanced automation, and low cost of ownership to support large-scale LED manufacturing. In 2025, global MOCVD for LED sales reached approximately 80 Units, with an average price of 1,980 K US\$/Units.

The key driver of the MOCVD for LED is the growing demand for energy-efficient and high-performance lighting solutions across residential, commercial, and industrial applications. MOCVD technology enables precise growth of high-quality III-V compound semiconductor materials, which are essential for producing LEDs with superior brightness, efficiency, and color consistency. Additionally, the rising adoption of LEDs in automotive lighting, display backlighting, and next-generation communication technologies further accelerates the need for advanced MOCVD systems.
