The mode-locked laser optical frequency comb is a special spectrum produced by mode-locked laser technology. Mode-locked lasers can produce ultra-short optical pulses that have an extremely high repetition frequency in time, and the time intervals between adjacent pulses are exactly the same. In the frequency domain, these pulses appear as a series of equally spaced frequency comb teeth, similar in shape to a comb, hence the name optical frequency comb. Optical frequency comb plays an important role in optical frequency measurement, just like a ruler or timer with a precise scale, enabling extremely precise optical frequency measurement.

The global Mode-locked Laser Frequency Comb market size is projected to grow from US\$ 332 million in 2024 to US\$ 485 million in 2030; it is expected to grow at a CAGR of 6.5% from 2024 to 2030.
