A Modular Billet Caster is a type of continuous casting equipment designed with a modular concept, offering enhanced flexibility, ease of installation, and maintenance in the steel - making process. Its modular structure means that it is composed of individual, standardized units or modules, such as the tundish module, mold module, secondary cooling module, and withdrawal - straightening module. These modules can be pre - fabricated separately and then assembled on - site, reducing construction time and costs. Each module can be designed and optimized for specific functions; for example, the mold module can be tailored to achieve precise control over the initial solidification of the molten steel, while the secondary cooling module can be adjusted to provide the right amount of cooling for different steel grades. This modular design also allows for easy replacement and upgrade of individual components, enabling steel producers to adapt the caster to changing production requirements, improve efficiency, and enhance the quality of the billets produced. Moreover, it simplifies troubleshooting and maintenance as problems can often be isolated to specific modules, minimizing downtime and ensuring continuous operation of the casting process.
