The global Modulated Thermal Imaging Analyzer market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A modulated thermography analyzer is an instrument for thermal analysis that analyzes the properties of a sample based on the temperature change that occurs when the sample is irradiated with light. The instrument generates periodic temperature changes by periodically applying a light source on the sample surface, and uses an infrared camera to record the temperature changes. By analyzing and processing the recorded temperature change data, information such as thermal conductivity, thermal diffusivity, and heat capacity of the sample can be obtained. Modulated thermal imaging analyzers are widely used in materials science, chemistry, biology and other fields.
