The global MOFs Material market size is predicted to grow from US\$ 138 million in 2025 to US\$ 272 million in 2032; it is expected to grow at a CAGR of 8.8% from 2026 to 2032.

MOFs materials, or Metal-Organic Frameworks, are a class of porous crystalline materials constructed from metal ions or metal clusters coordinated with organic ligands. They feature extremely high surface area, tunable pore size, designable structures, and abundant functional sites. Because their pore structure and surface chemistry can be tailored through metal nodes, organic linkers, and post-synthetic modification, MOFs materials show strong potential in gas adsorption and separation, carbon capture, hydrogen and methane storage, catalysis, sensing, drug delivery, water treatment, batteries, and supercapacitors. They are regarded as one of the key frontier materials in materials science and specialty chemicals. In 2025, global MOFs Material production reached approximately 1172 tons, with an average global market price of around 120 USD/kg. The production capacity for MOFs Material in 2025 was approximately 1200 tons. The typical gross profit margin for MOFs Material between 20% and 40%.

The MOFs materials market is currently in a transition stage from academic research and pilot-scale development toward broader commercialization. Although its market size remains smaller than that of conventional adsorbents, catalysts, and membrane materials, it offers strong growth potential. Demand is mainly driven by carbon capture and gas separation, hydrogen and methane storage, industrial emission treatment, air purification, water treatment, catalyst supports, sensors, and new energy batteries. With the rising demand for carbon neutrality technologies, clean energy, semiconductor manufacturing, drug delivery, and high-performance adsorption materials, MOFs are expected to achieve early commercialization in high-value and customized applications, while large-scale adoption is still constrained by production cost, batch consistency,

material durability, and long downstream qualification cycles.
