Dust refers to the solid particles suspended in the air and is one of the main factors in maintaining the temperature of the earth. Too much or too little dust in the atmosphere will have a catastrophic impact on the environment. However, in life and work, productive dust is the natural enemy of human health and one of the main causes of various diseases, especially coal mine dust. On the one hand, it seriously harms the health of workers and causes workers to suffer from pneumoconiosis; Excessive dust concentration also lurks the danger of explosion. The number of casualties caused by dust disasters is huge every year, and it also causes huge economic losses to the country. At present, the Ministry of Environmental Protection and the Coal Mine Safety Supervision Bureau attach great importance to dust hazards, and have formulated relevant standards for the dust emission concentration in the workplace, and strictly control the dust concentration to reduce dust hazards. Therefore, timely and effective monitoring of the dust concentration in the workplace can better grasp the dust concentration status, carry out effective dust removal and dust reduction, and play an extremely important role in ensuring personal safety and improving environmental quality. At present, countries around the world have done a lot of research on the measurement technology of dust concentration, and developed a series of dust monitoring instruments.
