A molded transformer is a transformer in which the winding section is impregnated and molded with epoxy or other resin. It is also called a dry-type transformer. When a transformer changes voltage, the iron core and windings heat up due to power loss in the transformer, so it is necessary to dissipate the heat. While oil is used to dissipate heat in general transformers, molded transformers do not use oil, making them superior in terms of safety against ignition and other hazards.

Because of their low risk of ignition in the event of an accident and their lightweight and small size, they are suitable for indoor use and are installed in buildings.

The global Molded Transformer market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
