Molecular imaging is a new biomedical research discipline which enables the quantification, visualization, and characterization of biologic processes taking place at the cellular and subcellular levels. Molecular imaging plays a very important role in diagnosis of early assessment, risk stratification, and follow-up of patients with neurological diseases. Imaging agents are the substances designed to improve the imaging output of specific organs, physiological functions, tissues and diseases. Molecular imaging agents are small molecules, peptides, engineered proteins, aptamers and nanoparticles. The main purpose of a molecular imaging agent is to cross-examine and report back about a specific target of interest during the course of a molecular imaging study.

Based on types, the global molecular imaging agents market is segmented into small molecules, peptides, engineered protein fragments, aptamers, nanoparticles and others. Amongst all, peptides have emerged as a very important type of molecular imaging agents. Based on application, the global molecular imaging agents market is segmented into oncology, cardiology, gastrointestinal disorders and neurology disoeder. Similarly, based on end user, the market is segmented into, hospitals and clinics, ambulatory surgical centers, diagnostic & imaging centers, and others. Diagnostic & imaging

centers are expected to hold maximum share in the market due to the ease of availability of medication.
