The global Molecular Oncology market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Molecular diagnostics in cancer is becoming more and more common in clinical laboratories. Targeted therapy possibilities for malignancies such as multiple myeloma, lymphoma, melanoma, lung, breast, ovarian, prostate, and others are now being assessed using molecular oncology assays. Molecular oncology researchers use a variety of methods, including as in-vitro and in vivo functional models, computational biology, genomics, and tumor imaging, to comprehend biological and clinical characteristics. The genes that produce these proteins may be used as targets in the development of novel anti-cancer medications, chemotherapeutic medicines, or imaging scans. These combinatorial methods are used in molecular oncology to confirm the involvement of novel candidate genes in the genesis of cancer.
