## Abstracts

The global Molybdenum 92 (Molybdenum-92 Isotope) market size is predicted to grow from US\$ 2.06 million in 2025 to US\$ 2.98 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

In 2025, global molybdenum 92 production reached approximately 139 Curie, with an average global market price of around US\$20 per millicurie. In 2025, the global 's total production capacity of molybdenum 92 reached 139 Curie. The industry average gross profit margin of this product reached 42%. Molybdenum-92 (Mo-92) is a stable isotope of the metallic element molybdenum (Mo), with an abundance of approximately 14.84% in natural molybdenum. It is a key precursor material for the production of the medical radioisotope Mo-99, which decays into technetium-99m, the most commonly used tracer in nuclear medicine diagnostics. The upstream process of Mo-92 involves molybdenum ore mining (China is the world's largest reserve and producer); the midstream process involves roasting and smelting the molybdenum concentrate, followed by further enrichment through isotope separation to obtain high-enrichment Mo-92; and the core downstream application is as a target material for irradiation in nuclear reactors to produce medical Mo-99, ultimately for use in hospital nuclear medicine departments. The main costs of Mo-92 include raw materials (molybdenum concentrate), extremely high energy consumption (the isotope separation process consumes a lot of energy), and depreciation of R&D and technology. Raw materials account for a significant proportion of the total cost of molybdenum products.

United States market for Molybdenum 92 (Molybdenum-92 Isotope) is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
