The global Molybdenum-Based Binary Alloys market size is predicted to grow from US\$ 760 million in 2025 to US\$ 1509 million in 2032; it is expected to grow at a CAGR of 10.2% from 2026 to 2032.

Molybdenum-based binary alloys are binary alloy materials formed by using molybdenum (Mo) as the base element and adding another main alloying element. Examples include molybdenum-aluminum alloys, molybdenum-rhenium alloys, molybdenum-titanium alloys, molybdenum-zirconium alloys, and molybdenum-niobium alloys. Because molybdenum itself possesses a high melting point, high strength, good thermal and electrical conductivity, and good high-temperature stability, adding another alloying element can further improve its high-temperature strength, creep resistance, toughness, oxidation resistance, corrosion resistance, and processing performance. Molybdenum-based binary alloys are commonly used in aerospace, electronics, semiconductors, vacuum furnaces, high-temperature structural components, nuclear industry, glass melting electrodes, and special equipment, and belong to an important branch of high-temperature refractory metal materials. Sales in 2025 were approximately 14,000 tons.

United States market for Molybdenum-Based Binary Alloys is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
